

Deployment condition		Platform	Binding quantity
On-demand inspection, recharged between sessions	→	Raspberry Pi 5	<i>latency non-binding; cost dominates</i>
Extended session away from power	→	Raspberry Pi 5	<i>endurance 8.2 W vs 11.8 W; ≈ two sessions vs one</i>
Several operators or blocks in parallel	→	Raspberry Pi 5	<i>2.94 units per Jetson unit for equal capital</i>
Hot enclosure (preliminary evidence)	→	Jetson Orin Nano Super	<i>thermal margin: Pi 5 at 76.0 °C, 6 °C below threshold</i>
Continuous scanning from a moving platform	→	Jetson Orin Nano Super	<i>latency binds: 5.36× faster at 2.94× cost</i>

Independent of the choice: sequential rather than concurrent scheduling (39.0-44.3% pest-latency reduction) and Docker containerisation, both at no measurable cost.
